

Version 0.6.10 Addendum - NPM Audit Fix

This addendum keeps the cumulative manual policy intact. The original manual remains at the beginning of the PDF, and this section records the dependency security update added in v0.6.10.

What changed

- Pinned Monaco Editor to version 0.53.0 to avoid the DOMPurify advisory chain reported by npm audit.
- Regenerated package-lock.json so DOMPurify is no longer installed as a Monaco Editor dependency.
- Added a root .gitignore to prevent node_modules, dist, src-tauri/target, target, .env files, zip files, and checksum files from being committed to GitHub.
- Synced the visible app version, package metadata, Tauri config, Cargo manifest, and manual references to 0.6.10.

Why this matters

GitHub Actions failed on npm run audit:npm because npm audit found moderate DOMPurify vulnerabilities through the Monaco Editor dependency chain. This fix follows the remediation path identified by npm audit while preserving the existing editor integration.

Recommended validation commands

Command	Purpose
npm ci	Install dependencies from the lock file.
npm run validate	Run TypeScript checks and smoke/unit/security tests.
npm run build	Build the frontend production output.
npm run audit:npm	Confirm npm audit reports zero moderate-or-higher vulnerabilities.
npm run check:rust	Run Rust backend validation on a machine with Cargo installed.
npm run tauri:build	Build the final native desktop app.

GitHub note

Before pushing source updates to GitHub, verify that generated folders are not included. The commands git ls-files src-tauri/target and git ls-files target should return no files.
