

Version Addendum - v0.6.4 Guided Onboarding + User Experience Upgrade

This addendum extends the cumulative Diligent Code Studio User Manual. The original manual remains at the beginning of the PDF, and each release adds new pages instead of replacing earlier instructions.

What changed in v0.6.4

Feature	Purpose
First-run Welcome Wizard	New users are greeted with a guided chooser for building a desktop app, building a website, opening an existing project, using AI with code, setting up the computer, or creating an installer/release.
Start Here dashboard	A new Start Here workspace gives users a clear path through setup, project creation, AI help, validation, and release packaging.
Guide Me button	The top-right toolbar now includes Guide Me. It opens AI Help with screen-specific guidance and a recommended next action.
What this page does cards	Every workspace page now has a short explanation and a practical next step so the software teaches the user while they are using it.
Beginner and Advanced modes	Beginner Mode keeps extra guidance visible. Advanced Mode reduces extra explanatory content while keeping the same core tools available.
Sample project prompts	The Start Here page includes sample project shortcuts to help new users learn by creating a small working project first.

Recommended first workflow

1. Check Setup & Dependencies to make sure the computer has the required tools.
2. Open an existing workspace or create a sample project from Templates.
3. Use the upper-right AI Help button or Guide Me when unsure what a screen does.
4. Use Editor and AI Coding Assistant to review files, fix bugs, and generate missing content.
5. Run validation from Problems or Terminal, then prepare a release with Release Builder.

Using Start Here and Guide Me

Start Here is designed for users who do not yet know the software. It answers the basic question: "What should I do first?"

The cards on the Start Here page move the user to the correct workspace. For example, Build a website opens Web Builder, Set up my computer opens Setup & Dependencies, and Create an installer or release opens Release Builder.

The Guide Me button gives screen-specific help. It opens AI Help with a prepared question and a built-in explanation of the current screen. If an AI provider is configured, the user can press Ask to receive a personalized response using current screen and workspace context.

Beginner and Advanced modes

Beginner Mode is recommended for new users. It keeps guidance visible and emphasizes safe next steps. Advanced Mode is intended for experienced users who already know the workflow and want less explanatory text.

Manual policy reminder

The manual remains cumulative. New release information is appended as addendum pages so earlier instructions and historical behavior remain available for reference.
