

Version 0.6.5 Addendum

Draggable Floating AI Help

Version 0.6.5 keeps AI Help minimized by default and accessible from the upper-right AI Help button, but the opened AI Help panel can now be moved to another part of the screen.

How to move AI Help

1	Click AI Help in the upper-right corner.
2	Place the mouse on the AI Help header. The header shows a Drag to move hint.
3	Drag the panel to the desired location on the screen.
4	Release the mouse. Diligent Code Studio saves the position for the next time AI Help opens.
5	Use the small reset-position button in the AI Help header to return the panel to the default upper-right area.

AI output behavior remains the same:

Questions asked inside AI Help display their answers inside the AI Help panel. Project-aware coding actions and full coding requests continue to route to the AI Coding Assistant workspace page unless the question is asked directly from AI Help.

This keeps the interface cleaner while allowing the user to place AI Help where it does not cover the current work area.
